# How tax works

**Taxation is the main way in which governments raise the revenue needed to pay for public spending. Governments may tax the public directly (such as with income tax) or indirectly (via VAT, for example).**

### How it works

Governments have the unique privilege of being able to demand that anyone in their country pay taxes. These can be divided into "direct" taxes, which are paid from earnings, either by people or by institutions, and "indirect" taxes, which are paid for out of consumer spending. Taxes can be levied as a share of spending or income, or as a flat rate. A progressive tax system is one in which richer individuals pay proportionately more tax.

Questions surrounding the level of taxation are hotly debated. As a result, taxation rates, and laws about who or what pays for which taxes, vary significantly from country to country.

### TAXES AND BEHAVIOUR

Some taxes are designed to reduce the amount of revenue that goods earn. Because a newly-levied or increased tax on a product raises its price, that item becomes less attractive to buy. Where a product, such as cigarettes, is harmful, higher taxes can be a way to reduce public consumption. In cases in which the behaviour of consumers does not alter much in response to higher pricing, however, the extra tax is likely to raise much more money. This can make such taxes appealing for governments seeking revenues.

## Direct and indirect taxes

People have to pay taxes on either their income, or on what they spend. Some typical taxes on an individual in the UK are shown below.
