

undamaged by frosts, since they flower relatively late in the year.

HARVESTING

Harvest berries every few days when they are plump, taking the core with them. Do not leave them too long or they will rot.

STORING

The berries will not keep long, so freeze them, if necessary. To prevent them from forming a solid mass, space them out on a baking sheet and place in the freezer. When frozen, transfer to a container. They will keep their shape and can be used singly.

PESTS AND DISEASES

Blackberries and hybrid berries suffer the same problems as other cane fruits: raspberry spur blight, raspberry beetle, and gray mold especially. Practice good garden hygiene when pruning, and destroy affected canes.

Gray mold shrivels and rots fruits.
