

'Jermor'

This variety produces long, coppery-brown shallots in clusters that contain six to eight bulbs. The flesh is pink-tinged in color, and has a good flavor. The shallots have a good skin finish and are uniform in shape and size, making them suitable for exhibition.

suitable for containers

late winter to mid-spring

some resistance

fairly hardy

mid- to late summer

'Ambition'

Seed-grown shallots, a relatively new phenomenon, are becoming more and more popular due to their low cost and excellent storage capabilities. Hybrid 'Ambition' yields firm, 2-in (5-cm) rust-colored bulbs with delicately flavored white flesh.

suitable for containers

early spring

good resistance

hardy biennial

late summer

'French Gray'

Many chefs consider the 'French Gray' shallot as the one true shallot. Grown only from sets, planted early in spring or in fall along with the garlic, it is not a long-keeping shallot. Mature bulbs are an elongated pear shape with thick, gray outer skins.

suitable for containers

early spring or mid-fall

poor resistance

cold hardy

late summer or early summer
