

▲ Built by **Foster, Rastrick & Company** in 1829, *Stourbridge Lion* was the first locomotive to be exported to the US. Owing to its weight, the locomotive wasn't very successful.

It was British inventor William Hedley who managed to build a steam locomotive that proved to be more useful than Trevithick's. His *Puffing Billy* began pulling coal trucks at the Wylam Colliery in northeast England in 1813. The true revolution, however, came about in 1814 after British engineer and inventor George Stephenson built *Blücher*, a locomotive for Killingworth Colliery in Newcastle-upon-Tyne, which hauled eight wagons carrying 30 tons of coal at 6 km/h.

Locomotives, however, would not become synonymous with passenger railways until September 1825 when the world's first passenger line to be paid for by public subscription opened between Stockton and Darlington in northeast England. The father-son duo George and Robert Stephenson created their locomotive, titled rather unimaginatively, the *Locomotion No. 1*.

The technology went global, adapted, rather quickly, in France in 1828, when engineer Marc Séguin built his own locomotive. The British-built
