

▲ **During the early years**, signals were manually operated by using heavy levers.

Implementing changes

The entire system witnessed major improvements in the 20th century. In 1926, the formation of the Signalling and Interlocking Standards Committee meant standardization of all equipment and systems. The creation of a block signalling manual and rules for underground signalling came up in the 1930s even as improved systems were adopted. These included track-circuiting, power signalling, automatic signalling, double wire signalling, and colour light signals. All these systems minimized human intervention and helped in handling larger volumes of traffic. These technological improvements were championed by the companies in western India. For instance, the GIPR was the first to introduce the colour lighting signalling on its Harbour
