

and every nut and bolt. A major part of their duty is to alert the driver in case of any fault and the job often continues well into the night regardless of the weather. Their tools include a hemp cord, hammer, spanner, red and green flags, and detonators. Those that inspect civil engineering structures, such as bridges and tunnels, use manual carts to move along tracks. They keep an eye on the tiniest of faults and assess the need for repairs or additional structures. In certain areas of the country, they battle challenging circumstances, threats from wildlife and dangerous terrain.

There are many others who keep the railways constantly operational, from gatemen stationed in small cabins at level crossings and ticket collectors, dressed in their characteristic white shirt, black trousers and coat, to the metal cutters, blacksmiths, engravers in production units, and sectional controllers at control rooms. Each one of them makes a significant contribution to the success of one of the biggest rail networks in the world.
