

The famous V-shaped Chenab River Gorge that the train will cross once the bridge is constructed. The beginnings of an arch can be seen on either side.

Given the politically volatile nature of the region, the Indian Railways worked closely with the Defence Research and Development Organization (DRDO) to design the bridge, which uses special blast-proof steel and can withstand a bomb blast. It has been constructed to withstand seismic forces likely in earthquake Zone V or of Very Severe Intensity, even though this area falls under Zone IV or of Severe Intensity. Sufficient redundancy has been built into the design to ensure that the bridge will not collapse even if one pier is removed. Wind tunnel tests were conducted to ensure that the bridge would withstand powerful gusts and, as a result, it can endure winds up to 266 km/h.
