

Gurugram, and Faridabad. Various other bodies engaged in metro construction have drawn upon its success and the DMRC has acted as a consultant for several other metro projects in the country.

Developments in other cities

Following the success of MRTS in Delhi, metro services were introduced in many other regions. Gurugram's Rapid Metro, India's first fully privately financed metro system, began operating in 2013. Keeping in mind the large numbers of passengers shuttling between Delhi and Gurugram, the Rapid Metro is also connected to the Delhi Metro. In Mumbai, different lines of the rapid transit system are being developed by different bodies. These include the Mumbai Metropolitan Region Development Authority (MMRDA), the Metro One Operation Pvt Ltd (MOOPL), and the Mumbai Metro Rail Corporation (MMRC). The first line, Versova–Andheri–Ghatkopar, entered operations in June 2014.

Chennai's metro also started services in June 2015 with the Chennai Metro Rail Limited (CMRL). In Noida, the metro service was developed by the DMRC on behalf of the Noida Metro Rail Corporation (NMRC) and it opened to commercial service in January 2019. In Ahmedabad, the metro service, developed by the Gujarat Metro Rail Corporation, opened to the public in March 2019 between Vastral Gam station and Apparel Park station. Other cities, such as Bengaluru, Hyderabad, Kochi, and Jaipur, have established their rapid transit system as well.

The construction

Metro services have mostly been introduced as alternatives to strained road transportation. Therefore, lines are either elevated or underground. This requires complex construction techniques, ranging from cut and cover method and ballastless tracks to heavy tunnel boring machines (TBMs) and box pushing technology. There has also been rapid technological improvement, for instance, with some trains on the Delhi metro network fitted with Unattended Train Operation technology, eliminating the need for manual operations.
