

The metro services provide an affordable and comfortable means of everyday travel. The trains are fully air conditioned and stations are equipped with modern facilities, such as escalators, vending machines, and shopping avenues. With the introduction of smart cards, passengers do not even need to stand in queues to buy tickets.

Metro services not only provide a huge carrying capacity, but are also environmentally friendly means of transportation. The Delhi Metro has even been certified by the United Nations as being the first metro rail system to reduce greenhouse gas emissions.

Time and again, the Indian Railways has proved to be a pillar of strength to the nation in times of crisis. In one such example, when Chennai faced a major water shortage in 2019, the Indian Railways stepped up to provide support. Seen here are workers collecting water from a special train with 50 wagons that carried 2.5 million litres of water for the city.
