

Eggs

Non-passerine birds

Glossy ibis eggs are not camouflaged.

Willow grouse eggs are laid on the ground where they are camouflaged.

Plains wanderer lays eggs in a grass-lined hollow.

Jamaican tody eggs are almost spherical and have an extremely thin shell.

Black shouldered kite eggs often have marks concentrated at one end.

Guira cuckoo eggs are, unusually for cuckoos, incubated by the parents.

Common guillemot eggs are sharply pointed.

Southern cassowary eggs have a grainy surface created by raised bumps.

Limpkin eggs are camouflaged to blend in with dead leaves of waterside plants.

Nacunda nightjar eggs have brown blotches.

Prairie chicken lays up to 16 eggs in each clutch.

Manila nightjar lays its eggs on bare ground.

Elegant tinamou eggs have a glossy sheen.

Passerine birds

Olive sunbird eggs have a distinctive ring of marks.

Cetti's warbler eggs are reddish-brown.

Bokmakierie eggs are blue with red spots.

Yellow-streaked greenbul eggs have sparse markings formed just before the egg is laid.

Cape crow eggs have a large amount of red spots or speckles on them.

Paradise riflebird eggs have dark streaks that look like brush marks.

Scarlet minivet eggs have variable patterns.

Black-capped mockingthrush's eggs are mottled with red spots.

Black and yellow grosbeak's eggs have streaks that may help to break up the outline.

Black-headed weaver eggs are laid inside a woven nest.
