

Frogs

Colours help camouflage frog in earth and leaf litter.

Asian painted frogs are burrowers that emerge onto the surface at night and inflate themselves if touched.

Foam-nesting frogs lay eggs in self-made foam in trees above water, into which the tadpoles drop.

Tomato frogs from Madagascar live on land, but breed in slow-moving or stagnant water.

Colour varies from deep red to pale orange.

Eyespots look like eyes to confuse predators.

Chilean four-eyed frogs have eyespots on their backs that deter predators.

Large digital discs help it land after gliding.

Malayan flying frogs cannot fly, but glide downwards.

Bright colours indicate it is poisonous to eat.

Yellow and black poison dart frogs live in cracks in riverside rocks.

Long fingers and toes

Paradoxical frogs develop from tadpoles twice their length and shrink as they "grow".

A diet of tiny invertebrates makes skin poisonous.

Green and black poison dart frogs have toxic skin.

Golden mantellas are poisonous frogs from Madagascar. They feed on small invertebrates.

Very wide mouth

African bullfrogs are large, carnivorous frogs that feed on other frogs, reptiles, and even mice and rats.

These toads can reach 20 cm (8 in) in length.

Common frogs are becoming rarer, partly due to the loss of wetland areas.

Smooth, slimy skin

Sticky pads below fingers

White's tree frogs are large Australian frogs.

Toads

Smooth skin is unusual for a toad.

Asian tree toads have flat digital discs, enabling them to climb riverside trees.

These toads run rather than hop.

Natterjack toads, also called running toads, are the rarest toads in Britain.

Developing eggs

Male midwife toads carry their eggs on their backs until they hatch into the water.

Fleshy horns project over eyes to enhance leaf-like appearance.

Asian horned toads resemble dried leaves, to escape discovery on the forest floor.

Narrow fingers used for feeding.

African clawed toads are totally aquatic.

Warty skin

Ornate horned toads from Argentina are large, aggressive toads with huge appetites.

Ornate horned toads may even eat others of the same species.

Cane toads were originally from South America.

Cane toads were introduced to Australia to control sugar cane pests, but have become pests themselves.

Mexican burrowing toads live in dry areas, rarely emerging onto the surface.

Webbed feet
