

integrated
speaker and
mouthpiece unit

**Ericsson table phone
1890**

This design was one of the first to have an integrated speaker and mouthpiece unit. Winding the handle alerted the operator at a telephone exchange to "open the line" for a call.

bell rings to indicate
incoming signal
from exchange

**Rotary dial phone
1931**

Popular during the mid-20th century, rotary telephones used a numbered dial to send a series of electrical pulses along the line. Switches at the exchange connected calls automatically.

dial

**Mobile telephone
1983**

Cellphones use radio waves to make wireless telephone calls via local antennae that form a cellular telephone network. The Motorola DynaTAC 8000x was the first truly hand-held cellular phone.

**Facsimile telegraph
1956**

Pictures were transmitted via the telegraph system as early as 1865, but the first device to use telephone lines for this was patented by Xerox in 1964. Once popular, faxes have now largely been superseded by e-mail.

**iPhone
2007**

Digital technology has changed cellphones beyond all recognition. The Apple iPhone, launched in 2007, brought together computer and phone technology.

**Webcam
2000s**

The development of webcams has enabled video calling over the Internet, and much communication has now been transferred to computers.

**Walkie talkie
1940**

Compact short-distance wireless "telephones" developed rapidly during World War II. Signals were typically sent using AM (amplitude modulated) radio waves.
