

17 Get the events

Now that you've written all the functions, you can use them to write the main part of the program. Put these two lines at the bottom of your file. The first line calls (runs) the `get_events()` function and stores the list of calendar events in a variable called `events`. The second line uses the `datetime` module to get today's date and stores it in a variable called `today`.

Use a backslash character if you need to split a long line of code over two lines.

Don't forget to save your work.

```
c.create_text(100, 50, anchor='w', fill='orange', \
font='Arial 28 bold underline', text='My Countdown Calendar')
```

```
events = get_events()
today = date.today()
```

18 Display the results

Next calculate the number of days until each event and display the results on the screen. You need to do this for every event in the list, so use a `for` loop. For each event in the list, call the `days_between_dates()` function and store the result in a variable called `days_until`. Then use the `Tkinter create_text()` function to display the result on the screen. Add this code right after the code from Step 17.

```
for event in events:
    event_name = event[0]
    days_until = days_between_dates(event[1], today)
    display = 'It is %s days until %s' % (days_until, event_name)
    c.create_text(100, 100, anchor='w', fill='lightblue', \
font='Arial 28 bold', text=display)
```

The code runs for each event stored in the list of events.

Gets the name of the event.

Uses the `days_between_dates()` function to calculate the number of days between the event and today's date.

Creates a string to hold what we want to show on the screen.

This character makes the code go over two lines.

Displays the text on the screen at position (100, 100).

19 Test the program

Now try running the code. It looks like all the text lines are written on top of each other. Can you work out what's gone wrong? How could you solve it?

My Countdown Calendar

It is 98 days until the test
