

Secret Messages

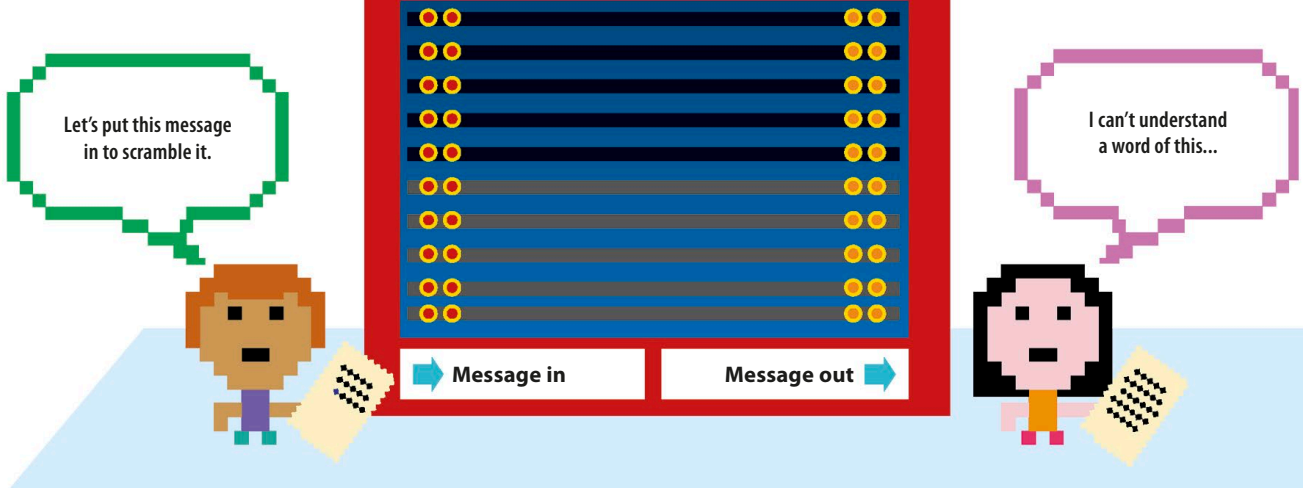

Swap messages with your friends using the art of cryptography – changing the text of a message so that people who don't know your secret methods can't understand it!

What happens

The program will ask you if you want to create a secret message or reveal what a secret message says. It will then ask you to type in the message. If you choose to make a secret message, your message will be turned into what looks like total gibberish. But if you choose to reveal a message, nonsense will be turned into text you can read!

► Share the code

If you share your Python code with a friend, you'll be able to pass secret messages to each other.

LINGO

Cryptography

The word cryptography comes from the ancient Greek words for "hidden" and "writing". People have been using this technique to send secret messages for nearly 4,000 years. Here are some special terms used in cryptography:

Cipher – a set of instructions for altering a message to hide its meaning.

Encrypt – to hide the secret message.

Decrypt – to reveal the secret message.

Ciphertext – the message after it has been encrypted.

Plaintext – the message before it has been encrypted.
