

5 Make some variables

Under the code for Step 3, add the variables that the program needs, and create a dictionary to store the buttons in. For each attempt at a match, you need to remember whether it's the first or second symbol in the match. You also need to keep track of the first button press so you can compare it with the second button press.

```
root.resizable(width=False, height=False)
```

```
buttons = {}
```

This is the dictionary.

```
first = True
```

This variable is used to check if the symbol is the first in the match.

```
previousX = 0
```

```
previousY = 0
```

These two variables keep track of the last button pressed.

6 Add the symbols

Next type the code below to add the symbols the game will use. As in the Nine Lives project, the program uses Unicode characters. There are 12 pairs, making 24 in total. Add this code under the variables added in Step 5.

U+2702

U+2705

U+2708

U+2709

U+270A

U+270B

U+270C

U+270F

U+2712

U+2714

U+2716

U+2728

```
previousY = 0
```

```
button_symbols = {}
```

The symbol for each button is stored in this dictionary.

```
symbols = [u'\u2702', u'\u2702', u'\u2705', u'\u2705', u'\u2708', u'\u2708',  
           u'\u2709', u'\u2709', u'\u270A', u'\u270A', u'\u270B', u'\u270B',  
           u'\u270C', u'\u270C', u'\u270F', u'\u270F', u'\u2712', u'\u2712',  
           u'\u2714', u'\u2714', u'\u2716', u'\u2716', u'\u2728', u'\u2728']
```

This list stores the 12 pairs of symbols that will be used in the game.

The `shuffle()` function from the `random` module mixes up the shapes.

7 Shuffle the symbols

You don't want the symbols to appear in the same place every time. After several games, the player would remember their positions and would be able to match them all at first attempt, every time. To prevent this, you need to shuffle the symbols before each game starts. Add this line after the list of symbols.

```
random.shuffle(symbols)
```

Shuffle mode is my favourite!
