

## REMEMBER

## Nested loops

You might remember reading about nested loops on page 35. You can put as many loops inside one another as you want. In this project, the outer loop runs six times. Each time the outer loop runs, the inner loop runs four times. So in total, the inner loop runs  $6 \times 4 = 24$  times.

## 9

**Start the main loop**

Now start Tkinter's **mainloop**. Once this loop starts, the GUI will be displayed and it will start listening for button presses. Type this line after the code you added in Step 8.

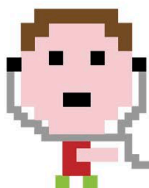

```
button_symbols[x, y] = symbols.pop()
```

```
root.mainloop()
```

## 10

**Test your code**

Run the program again. Your Tkinter window should now be filled with 24 buttons arranged in a grid. If it doesn't look similar to the picture shown here, check your code carefully for any errors.

```
previousX = 0  
previousY = 0
```

**Matchmaker**
