

Hacks and tweaks

Have a go at remixing your program to add these extra features. Can you think of any other ways to make it even more cracker-proof?

▷ Add more words

To increase the number of possible passwords, add more words to the lists of nouns and adjectives. Think of unusual or silly words that will stick in your mind if they appear in a password.

```
nouns = ['apple', 'dinosaur', 'ball',
         'toaster', 'goat', 'dragon',
         'hammer', 'duck', 'panda',
         'telephone', 'banana', 'teacher']
```

```
while True:
```

```
    for num in range(3):
```

The **for** loop runs 3 times, and selects 3 different passwords.

```
        adjective = random.choice(adjectives)
```

```
        noun = random.choice(nouns)
```

```
        number = random.randrange(0, 100)
```

```
        special_char = random.choice(string.punctuation)
```

Keep these lines indented.

```
        password = adjective + noun + str(number) + special_char
```

```
        print('Your new password is: %s' % password)
```

```
    response = input('Would you like more passwords? Type y or n: ')
```

△ Get multiple passwords

Change the code so your program will create and display three passwords at once. You will need to use a **for** loop. Put it inside the **while** loop.

▷ Make it longer

Make the password longer and more secure by adding another word into each password. You could create a list of colours, then select a random colour to add to each password.

Add a random colour.

```
Your new password is: hairybluepotato33%
```
