

6 Colour it!

You've drawn a nice, neat star, but it looks rather dull at the moment. Let's add some colour to make it more attractive. Change the code as shown on the right to paint your star yellow.

7 Run the project

The turtle should draw a yellow star. See if you can change the star's colour by editing the code.

```
import turtle as t
```

```
size = 300
```

```
points = 5
```

```
angle = 180 - (180 / points)
```

This sets the star's colour to yellow.

```
t.color('yellow')
```

```
t.begin_fill()
```

```
for i in range(points):
```

```
    t.forward(size)
```

```
    t.right(angle)
```

This fills the star with colour.

```
t.end_fill()
```

8 Draw different stars

Try changing the number after the equals sign in the variable **points** and you'll see that you can draw different stars. Note that the code only works for stars with odd numbers of points. Even numbers will mess things up.

EXPERT TIPS

Holey stars

On some computers your star might look slightly different or even have a hole in the middle. The appearance of Python's Turtle Graphics can vary depending on the type of computer you use, but this doesn't mean that your code is wrong.

Don't forget to save your work.
