

Hacks and tweaks

You can now create stars on demand. Why not try using the `draw_star()` code in your own projects. Here are just a few ideas.

△ Change your stars

To change how varied your stars look, alter the numbers in the brackets of the `ranPts` and `ranSize` variables in the `while` loop.

▽ Design a constellation

A constellation is a pattern of stars in the night sky. Try creating a list of `(x, y)` positions for stars in a constellation of your own design. Then use a `for` loop to draw the stars at those locations.

▷ Draw some planets

Investigate the `turtle.circle()` function and see if you can use it to make some planet-drawing code. Here's some code to get you started.

```
def draw_planet(col, x, y):
    t.penup()
    t.goto(x, y)
    t.pendown()
    t.color(col)
    t.begin_fill()
    t.circle(50)
    t.end_fill()
```

It's all in the mouse control!

▷ Click for the stars

Instead of letting the turtle draw stars randomly, try using the `turtle.onScreenClick()` function to draw a star wherever you click with the mouse.

▽ Speed up the turtle

You can change how fast the turtle draws the stars by creating a `speed()` function. Just add `t.speed(0)` at the start of the main code to give the turtle more zip. You can see all the `turtle` module's functions in Python's "Help" section.

I'm quick on the draw!

Try to add some rings around your planets.

We're lost! You'll have to get out and ask the way...

Has anyone seen a planet around here?
