

Movie projectors developed quickly after Edison's early work.

Early movie projector

Thomas Edison (1847–1931)

Thomas Alva Edison produced more than 1,000 inventions, including long-lasting lightbulbs, batteries, and movie projectors.

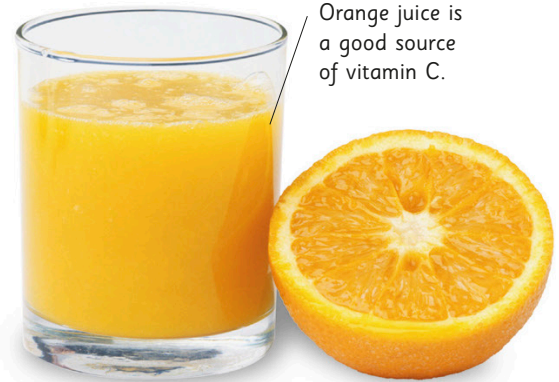

Karl Landsteiner (1868–1943)

Austrian-born physiologist Landsteiner discovered that human blood can be divided into four main groups—A, B, AB, and O. This laid the foundation of modern blood groupings.

Blood transfusions play an important part in modern medicine.

Red blood cells

Orange juice is a good source of vitamin C.

Albert Szent-Györgyi (1893–1986)

The Hungarian scientist Albert Szent-Györgyi is best known for discovering vitamin C. He also pioneered research into how muscles move and work. In 1937, he won the Nobel Prize for physiology and medicine.

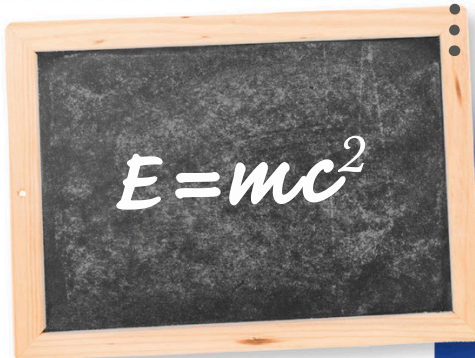

You inherit your blood type from your parents.

1800

1850

Albert Einstein (1879–1955)

German-born physicist Albert Einstein's famous equation $E=mc^2$ explained how energy and mass are related. It helped scientists understand how the universe works.

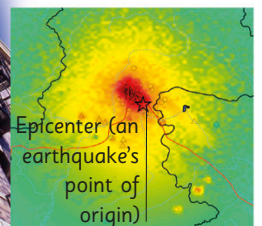

Einstein's equation

A "great" earthquake (8–9.9 on the Richter scale) strikes on average once a year.

Earthquakes destroy homes and office buildings.

Charles Richter (1900–1985)

Richter developed a way to measure the power of earthquakes. He worked on his scale with fellow physicist Beno Gutenberg.

Epicenter (an earthquake's point of origin)
