

Pythons can go without food for months after one big meal!

Making babies

Most animals reproduce when a female egg is fertilized by a male sperm. Some animals give birth to babies, while others lay eggs.

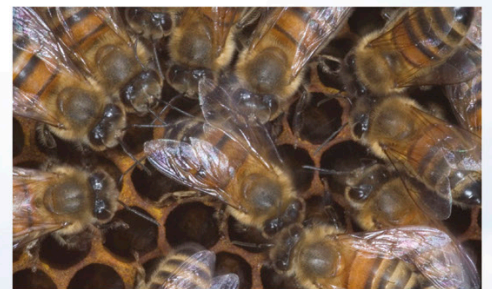

Birds lay hard-shelled eggs that hatch into chicks or ducklings.

Baby birds have to break out of the egg on their own.

Most beetles will send "messages" to other beetles using special chemicals.

Honey bees constantly communicate. They give directions with a special dance.

Giraffes have seven vertebrae in their necks—the same as most other mammals. They are just much longer.

Monkeys scream at each other to sound an alarm.
