

Animal reproduction

Every kind of animal has young—this is called reproduction. Usually, it happens after males and females mate.

Zebra mother and baby

Mammal reproduction

After animals mate, egg cells develop inside the mother. With mammals, the eggs develop fully into babies before the mother gives birth.

A mother macaque holding her baby

Helpless creatures

Monkeys and apes need years of nurturing before they can look after themselves.

An elephant develops inside its mother for two years!

Family ties

Elephants look after their young longer than any other animal except for humans.

Like all mammal babies, elephants drink milk from their mother.
