

Color blindness

Some people have a gene that causes them to be color blind. Look at the circle below. If you can see the number inside then you aren't color blind.

Test your family and friends to see if anyone you know is color blind.

Seeing double

Identical twins share most of their genes. A quarter of these are mirror twins, which means that they are a mirror image of each other. For example, they might have an identical mole, but on the opposite arm to each other.

Who do you look like?

Children have a mixture of genes from their parents. This is why you might have your mom's eyes but your dad's smile!

The chromosomes of your father determine whether you are a boy or a girl.
