

The digestion ride

Take a ride down your digestive system as it breaks down your food to take out the nutrients and get rid of waste.

Mouth

First stop is the mouth. Saliva moistens the food to make it easier to chew and swallow. Food then heads down the esophagus to your stomach.

Stomach

In your stomach, muscles churn the food around. Stomach acids help turn it a semi-liquid before it is squirted into the intestines.

Liver

Your liver stores some vitamins and a sugar called glucose, which gives you energy.

Intestines

Your intestines are a long, tangled tube. The small intestine absorbs food into your bloodstream. The large intestine deals with undigested leftovers.
