

Ready to fall

Maple trees shed their leaves in the fall. Before the leaves die, they change from green to golden, orange, or red. The color changes because a chemical reaction in the leaves breaks down a green compound called chlorophyll inside leaf cells.

Solid as a rock

Concrete is made by mixing gravel, sand, cement powder, and water. A chemical reaction between the water and cement makes the mixture harden permanently to become as solid as rock—ideal for building dams and houses.

Maple leaves turn orange as they die.

Rust

Iron reacts chemically with oxygen in the air to form rust—a flaky, reddish-brown compound. Rust can ruin cars, so the metal is painted to protect it.
