

Energy chain

Changing energy from one type to another is called “energy conversion.” The steps can be linked to make an energy chain.

Coal contains chemical energy.

Burning coal produces heat energy, which is used to boil water. Boiling water creates steam.

Moving steam is a form of kinetic (motion) energy, which operates turbines.

The kinetic energy produced by the moving turbines creates electricity.

Electrical energy used by television sets changes into light, sound, and heat energy.

Energy changes

All around you, energy is being converted from one form to another. You can see these changes happen—switching on a light turns electrical energy into light energy.

Driving force

Car fuel is full of chemical energy. When the engine starts, the chemical energy is changed to heat energy.

This is the first in a series of energy changes that make cars run.

Heat to sound

Some heat energy becomes sound energy.

The roar of a race car engine can be deafening!
