

Galaxies

Galaxies are groups of stars held together by gravity. There are more than 100 billion stars in a typical galaxy. Galaxies are different shapes. Some are spirals and some are oval.

Picture detective

Look through the Earth and Space Science pages. Can you identify the picture clues below?

Near neighbor

The nearest galaxy to our own is the spiral-shaped Andromeda galaxy. It would take around 2.2 million years to get there—if you were traveling at the speed of light!

The Milky Way

Our solar system is part of a galaxy called the Milky Way. From the inside (where we are), it looks like a haze of light in the sky.
