

The 1960s

The Cold War years gave rise to ever-faster jets, sleek spy planes, and a number of experimental aircraft (X-planes). Increasingly sophisticated helicopters were developed to support ground troops in warfare. Airliners such as the Boeing 707, Douglas DC-8, Convair 880, and Vickers VC10 came into use on the long-haul routes, signaling the dominance of the jet engine. Smaller jets including the Boeing 727, Caravelle, and DC-9 replaced the piston-twin aircraft types on medium- and short-haul routes.
