

THE COCKPIT

Concorde operated in a very challenging environment—temperatures around the fuselage reached 194°F (90°C) at 1,522 mph (2,450 km/h) and the aircraft expanded by some 8 inches (20 cm) during supersonic flight. The cockpit was crammed with instrumentation to monitor the aircraft's sophisticated flight systems. The flying controls were all “fly-by-wire,” 195°F using two separate systems linked to a hydraulic Flight Control Unit.
