

Duo Discus Glider

The Duo Discus, also known as the “white glider,” was created by German gliding experts Schempp-Hirth as a multipurpose glider. The two-seat configuration allows it to be used as an advanced trainer but its high performance level also appeals to qualified pilots for competition flying. In experienced hands the Duo can travel distances of several hundred miles. The Duo Discus XLT variant even boasts a small 30 hp “self sustainer” engine.

SCHEMP-P-HIRTH GLIDERS was set up in Göppingen, Germany, in 1935 by Martin Schempp and Wolf Hirth. Among the company’s most popular gliders is the single-seat Discus, manufactured from 1984 to 1995, which remains in production in the Czech Republic. This model was succeeded by the Duo Discus in 1993 and the Discus 2 in 1998.

Although the two-seat Duo Discus shares the name of the earlier machine, the new aircraft bears little resemblance to the single-seat Discus. The 65-ft 7-in (20-m) span wing on the latest version

incorporates landing flaps linked to the air brakes, making the glider ideal for training schools. Built from glass and carbon-fiber reinforced plastic, each glider has a GPS flight recorder as well as a radio and basic flight instruments. Equipped with electronic location transmitters (ELTs) and wing and tail water ballasts to improve performance in competition racing, the Duo Discus can stay in flight for more than six hours. More than 500 examples have been built to date and the type serves in the US Air Force as the TG-15A.

SPECIFICATIONS	
Model	Schempp-Hirth Duo Discus, 1993
Origin	Germany
Production	More than 500
Construction	Steel tube and fiberglass-reinforced plastic (GFRP)
Wingspan	65 ft 7 in (20 m)
Length	28 ft 3 in (8.73 m)
Maximum weight	1,543 lbs (700 kg) (with water ballast)
Engines	None
Range	Dependent on skill
Top speed	164 mph (263 km/h)
