

Cooling baffle

Strategically placed sheet metal baffles direct cooling air around the cylinders and keep the engine at its optimal temperature.

Intake manifold

Raw fuel is mixed with air by the carburettor. This fuel/air mixture is then fed into the intake manifold, which distributes the mixture to the cylinders.

Exhaust pipe

After combustion, the by-products are discharged into the exhaust system. Each cylinder has its own exhaust pipe.

Carburettor

The carburettor is the device that mixes raw fuel with air to produce a combustible mixture. It is bolted to the intake manifold.

Throttle linkage

Throttle and mixture controls allow the pilot to adjust engine power and the fuel flow as air density reduces with increased altitude.

Magneto

Self-contained ignition source, duplicated on the other side.

Oil pump

The oil pump supplies pressurized oil to all key bearings and other components that need lubrication.

Oil supply pipe

Filtered oil is pumped through the oil supply pipe to the main bearing oil pipe.

Oil pump suction pipe**Main bearing oil pipe**

Oil for the crankshaft main bearings and connecting rod bearings is fed from this external oil pipe.
