

The 1930s

The “golden age” of aviation between the world wars brought aircraft that were safer and more reliable than ever before. In 1935 the DC-3 revolutionized air travel with higher speeds and greater range than its rivals, and provided sleeper berths for up to 21 passengers. The glamour of air travel remained the province of the wealthy, who could afford the high ticket prices of the time. The future of flying was hinted at in 1939 with the arrival of the first turbojet-powered aircraft, the Heinkel He178.
