

WHICH WAY DOES YOUR YARD FACE?

When selecting plants, take time to assess the direction in which your yard faces and the amount of sunlight it receives every day. Understanding these aspects will help you make the right plant choices and also plan where to place trees and shrubs that may cast shade over your plot. With many plants suitable for areas in both sun and shade, there is a great choice for every situation.

SOUTH-FACING SITES

Sunny for most of the day in summer, south-facing sites provide optimal growing conditions for many flowering plants. However, soils dry out quickly here, and additional watering may be needed to support some species.

NORTH-FACING SITES

Many architectural foliage plants and a selection of flowers enjoy the shady, cool conditions of north-facing sites. When planting, position trees and large shrubs at the end of your plot to prevent them from casting even more shade.

EAST-FACING SITES

These plots are sunny for many hours until midafternoon, and will support a large group of flowering and foliage plants that thrive in part or dappled shade. Grow sun-loving plants in areas of the yard that are bright for the longest periods.

WEST-FACING SITES

Sunny from noon to evening in summer, west-facing yards provide ideal conditions for plants that are happy in full sun, or partial and dappled shade. Sun-loving plants should thrive in the brightest areas of a west-facing plot.
