

CLIMBERS

When planting climbers, use stakes to guide the stems toward a permanent support, such as a fence. Prepare the soil and planting hole as for perennials (*see p.18*), at least 12in (30cm) from the support; dig a deeper hole for clematis, which should be planted with the root ball 3in (8cm) below the soil. Place the stakes in the hole before positioning the plant with its root ball angled slightly toward the supporting structure.

Attaching horizontal wires Insert screw eyes 18in (45cm) apart along a fence, or use a drill and screw anchor to secure them into walls. Fix horizontal wires between the screw eyes.

Providing initial support Dig a planting hole and insert three or four evenly spaced stakes into the base. Tie the top of the stakes to the wires to hold them in place.

Planting the climber Place the plant and backfill with soil and firm it to remove air pockets. Then, spread out the stems and tie them loosely to the stakes with soft twine.

Aftercare After planting, water well and add a mulch of organic matter or chipped bark to suppress weeds. Keep the mulch clear of the stems. Water regularly in the first year.

AQUATICS

Marginals and deep-water aquatics are planted using one simple method. Plant them in sterilized topsoil or heavy clay in pond baskets or planting bags. These hold the soil in place while allowing water to pass through, aerating the roots, and keeping the plants healthy.

Deep-water aquatics, such as water lilies, are best set on bricks on the bottom of the pond after planting to allow their

leaves to float on the surface. Remove the bricks as the plant grows. Alternatively, deep-water plants can be suspended in the water using string and gradually lowered to the correct depth.

Set marginal plants on shelves in shallow water at the edge of the pond. Oxygenators, such as hornwort, do not require planting; simply place them in water at least 12in (30cm) deep, and they will spread out just beneath the surface.

Filling the pond basket First, line the bottom of the pond basket with clay or sterilized topsoil. Remove the plant from its original container and place it in the basket.

Planting the aquatic Fill around the plant with more compost and press gently in place. Apply a layer of pea gravel evenly over the surface to prevent the soil from floating out.

Aftercare Divide mature aquatics and marginals in spring. Remove plants from their baskets, cut up the root balls with a knife, and repot healthy sections. Topdress with grit or pea gravel.
