

Defence

Many insects make delicious meals for other animals. So, it is very important that they have some defence against the enemy.

Camouflage

A good way for insects to “disappear” is to hide amongst plants. This white orchid mantis is hiding in plants that are the same colour as it is. Can you find it?

Orchid mantis

The orchid mantis can change colour from pink to white depending on what colour flower it is on.

Lost among leaves

This katydid, a kind of bush cricket, looks so much like a leaf that it even has veins on its back. All it has to do is keep very still.

The butterfly's “eye”
