

Glowworms can sometimes be seen at night glowing and flashing in their thousands.

Glowworms are found all over the world.

Glow in the dark

Glowworms are not worms, they are beetles. They have a special organ in their bodies that lights up in the dark. They flash their bodies at night to communicate with each other.

Bugs

Members of the bug family look quite like beetles, but they have a feeding tube that pierces and sucks up their food. They cannot bite and chew.

Bugs

They are small, but some can be quite aggressive!

Shield bug: it is known as the "stink bug" because it can let out a foul smell.

Coreid bug: this bug waves the flaps on its legs to scare predators.

Aphid: this little creature is a pest. It attacks garden plants.

Assassin bug: it kills other insects and sucks their insides out.

Clicking cicadas

Cicadas, a type of bug, are the noisiest of insects. They can be heard up to 1.5 km (1 mile) away. They make their noise by vibrating drum-like pads on the side of their tummies.

weird or what?

The deathwatch beetle eats through wood. When it wants to attract another beetle's attention, it bangs its head against the wood. Sometimes people hear the tapping in their houses.

Some cicada species can live for up to 17 years!
