

invertebrate Animal, such as an earthworm, that does not have a backbone

larva Young form that hatches out of the eggs of insects. They usually look very different from their parents. For example, a caterpillar becomes a butterfly

mammal Warm-blooded animal whose body is covered in fur (or hair) and who produces milk to feed its young

marsupial Type of mammal whose females have pouches to carry their young

metamorphosis
Major change that happens to the bodies of certain animals as they grow from babies to adults. Tadpoles turn into frogs through metamorphosis

migration Long-distance, seasonal journey made by some animals to find food, warmer weather, or to breed

mollusc Invertebrate that has a soft body without any divided parts, often covered by a shell. A snail is a mollusc

non-insect Any invertebrate that is not an insect, such as starfish, centipedes, and worms

parasite Animal that lives on or inside another species in order to feed off it

plankton Tiny creatures that live in water in huge numbers. They serve as food for sea animals

predator Animal that hunts other animals for food

primate Mammals that have hands and feet that can grasp, a large brain, and good vision. Gorillas are primates

reptile Cold-blooded animals that breathe through lungs, usually lay eggs, and are covered with scales or bony plates. Snakes are reptiles

scales Thin, flat, and hard plates that cover the bodies of certain animals, such as reptiles and fish

scavenger Animal, such as a hyena or vulture, that feeds on the remains of dead animals

shoal Large number of fish swimming together

species Type of living thing that can breed with others of the same type

thorax Middle part of an insect's body to which the wings and legs are attached

venomous Describes animals that use poisonous fangs or stings to kill or paralyse their prey and enemies

vertebrate Animals that have a backbone and an internal skeleton
