

## Nesting

Swifts, such as this chimney swift, spend a lot of their time in the air but they must land when they are ready to nest.

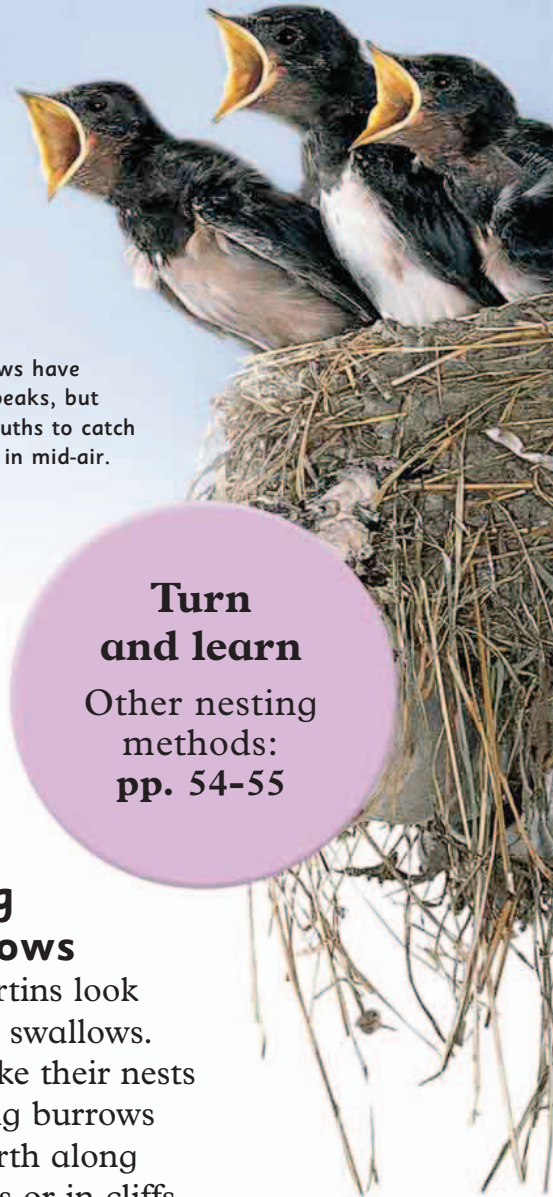

## Swallows' nests

Swallows collect mud pellets and mould them into cup-shaped nests. These can often be seen beneath the eaves of buildings. The parents feed the chicks by hovering near them rather than landing.

Forked tail

Swallows have small beaks, but big mouths to catch insects in mid-air.

## Turn and learn

Other nesting methods:  
pp. 54-55

## Nesting in burrows

Sand martins look similar to swallows. They make their nests by digging burrows in soft earth along riverbanks or in cliffs.

Swift

## The swift

Swifts can spend a lot of time in the air without landing. They even sleep on the wing!
