

Freshwater birds

If you search around fresh water anywhere in the world, you will find teams of birds living on it or near it. Some are swimmers and others are waders.

Kingfishers

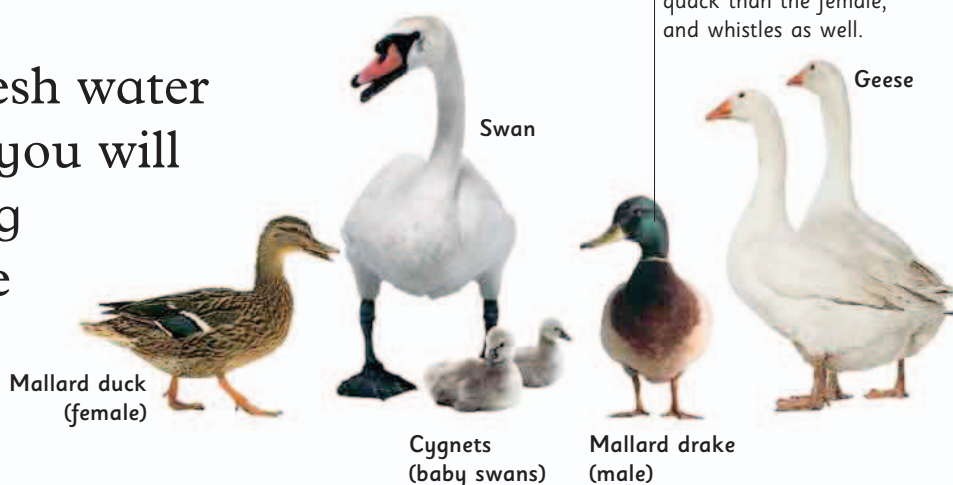

Kingfishers live by rivers. They perch on branches above the water waiting for fish to swim past. When they see one, they dive!

When the kingfisher catches a fish, it flicks its wings, resurfaces, and flies away with its dinner.

The male mallard makes a lower pitched quack than the female, and whistles as well.

Waterfowl

Ducks, geese, and swans are waterfowl. They have boat-shaped bodies and webbed feet, which make them very good swimmers.

Bottoms up!

Waterfowl have long bills with sharp ridges along them to grip slippery fish. Mallards often feed by tipping their heads into the water to reach plants.
