

Flamingo

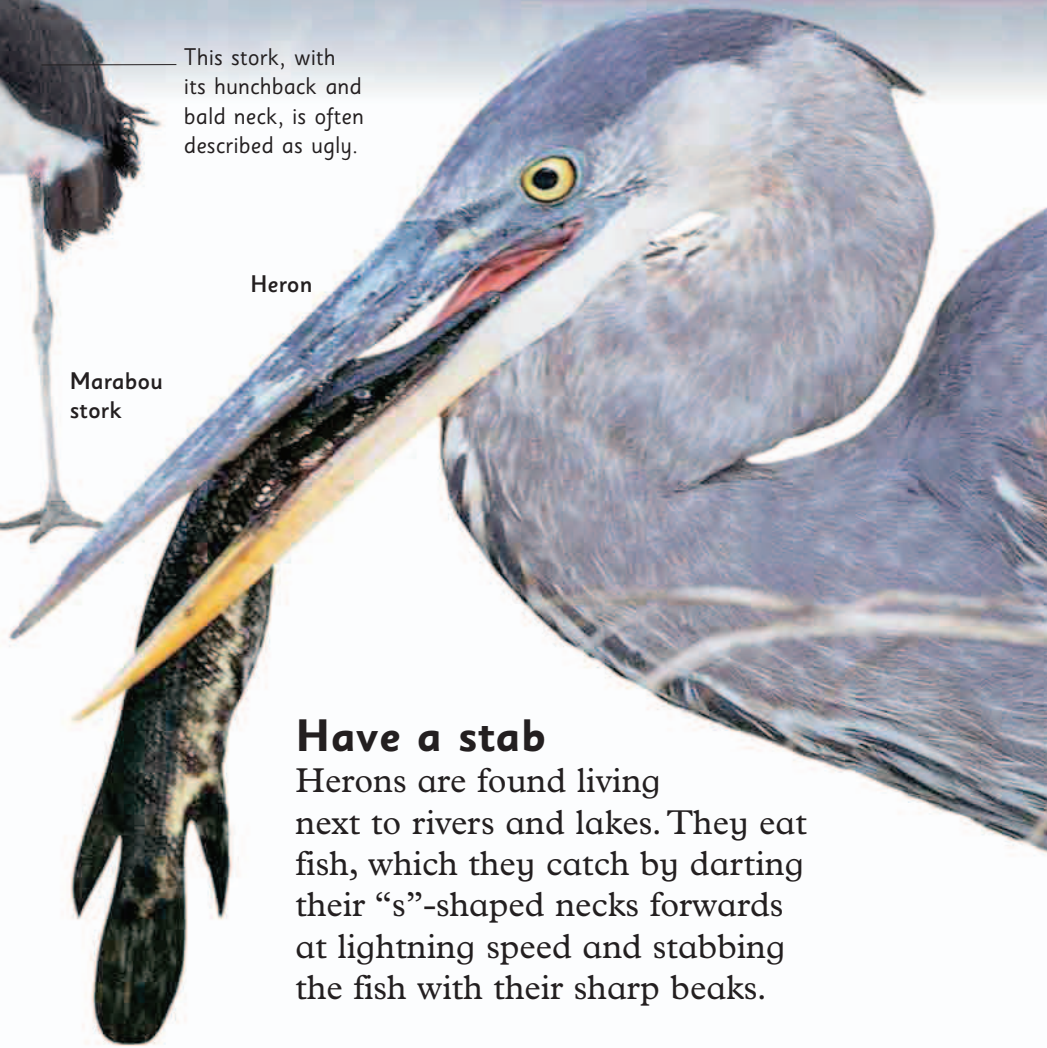

Black-crowned night heron

Wattled jacana

Marabou stork

This stork, with its hunchback and bald neck, is often described as ugly.

Heron

Waders

Waders have long legs that allow them to walk in shallow water without getting their feathers wet. Some also have long necks for finding food.

Have a stab

Hérons are found living next to rivers and lakes. They eat fish, which they catch by darting their “s”-shaped necks forwards at lightning speed and stabbing the fish with their sharp beaks.

Flamingos sleep in the water, often on one leg.

Flamingos' bills act like sieves to filter out tiny food from the water.

Pink flamingos

Flamingos live in huge flocks, of sometimes a million birds! Many of them are pink because of the tiny shrimps that they eat.
