Birds of prey

Hawks, buzzards, and eagles from North America fly south to warmer climates as the winter approaches.

Bald eagle

Eagles use warm air currents to help them glide.

Knots

Knots leave the Arctic in the autumn and fly towards South America. They travel over the 3,218 km (2,000 miles) of ocean non-stop.

"V" formation

Many birds fly in a "v" formation because the bird in front makes the air easier to fly through for the ones behind.
