

Chameleon

Losing the tail

Some lizards are able to detach part of their tail if it is grabbed. Often the tail will carry on wiggling when it has broken off, which can distract the enemy.

This tree skink has broken its tail and is growing a new one.

Lunch time

Most lizards eat meat. Some eat small animals; some can eat animals bigger than themselves. This chameleon flicks out its enormous, sticky tongue and catches insects on the tip.

The Komodo dragon can grow to 3 m (10 ft) long.

Enter the dragon

The Komodo dragon is the largest of all lizards. It is so powerful it can catch and kill animals bigger than itself. It has a long forked tongue that it uses to taste the air and search out dead animals. It lives in Indonesia.

A touch of venom

The Gila monster is one of only two species of venomous lizards. When it has caught a victim, it chews the venom into their bodies to kill them.

Thorny devil

Gila monster

Thorny defence

The thorny devil has a very tough defence. Its back is covered with sharp spines, which make picking it up and eating it very difficult indeed.
