

Color mixing

It is easy to mix watercolor paints to make new colors, both in a palette and on paper. The recommended basic palette of ten colors (*see p.12 and below*) includes the three primary colors, green, and browns, so you will be able to mix a wide range

of colors. There are several shades of some colors; for example, there are two reds: cadmium red and the bluer alizarin crimson. The different shades of a color react differently when mixed with other colors, increasing the range of colors you can create.

LIGHTENING COLORS

By varying the amount of water you add to paint, you can create a range of different shades from light to dark. If you want the paint to retain its

translucency, you should always make colors lighter by adding water rather than white paint, which makes colors opaque.

Cadmium yellow

Alizarin crimson

Cerulean blue

Sap green

Burnt sienna

Cobalt blue

Raw sienna

Cadmium red

Burnt umber

French ultramarine
