

## MIXING COLORS ON A PALETTE

Squeeze a small amount of paint from a tube onto your palette. Dip a brush into a jar of clean water, then mix the water with the paint. Add more water until you have the color you want.

Watercolors look lighter when dry, so it is a good idea to test colors on a spare piece of paper, or around the edge of your color test sheet (see p.37), before using them in a painting.

Rinse your brush after mixing each new color and keep the water in your mixing jar clean. To blend two colors, mix the dominant color with water, then gradually add the second color.

Make sure the dish or palette you are using has room to dissolve the pigment in a smooth puddle.

Use a white palette or dish, or a glass plate with white paper underneath, so you can see the color you are mixing.

## MIXING COLORS ON PAPER

Mix two different colors with water in separate wells in your palette. Paint the first color onto your paper with a clean brush. While this is still wet, add the second color and it will mix on the paper to create a new color. Sometimes when you

mix two colors, they will look grainy. This granulation occurs when the paints mixed have different weight pigments from each other. Try mixing colors to see which ones granulate. The effect is good for creating textures.

### GRANULATION

|                                                                                    |                                                                                     |                                                                                      |
|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|  |  |  |
| French ultramarine mixed with alizarin crimson granulates a little.                | Cerulean blue mixed with alizarin crimson granulates a lot.                         | Cobalt blue mixed with alizarin crimson does not granulate.                          |
|  |  |  |
| French ultramarine mixed with raw sienna granulates a little.                      | Cerulean blue mixed with raw sienna granulates a lot.                               | Cobalt blue mixed with raw sienna does not granulate.                                |
