

PENSION CONTRIBUTIONS

Calculations by a British consumer association reveal that to achieve an annual pension income of £15,000 by age 68, savers starting at age 25 need to save £165 a month. Starting at 35 would mean having to save £215 a month.

A professional financial adviser can calculate exactly how much an individual needs to save to meet their retirement goals, and offer advice on the different types of pensions and investments available.

50% of one's age is the percentage of salary to save for retirement when starting a pension.
